Consumption of fats and oils in food products decreased by 0.9 pounds per capita in 2005 compared with the previous year. The 84.2 pounds consumed per person during 2005 computes to a 1.1% decrease compared with 2004, and marked the third consecutive year that consumption of these products registered a decrease on a per capita basis. Prior to 2003, per capita consumption had increased in 15 of the previous 21 years. It should be noted that unusually large consumption increases for the baking/ frying and the salad/ cooking categories in 2000 coincided with a change in the data source. Census Bureau data was the source for these categories prior to 2000, while USDA, Economic Research Service estimates were used for 2000 - 2002. Comparisons between the time periods for these two categories and for all food uses may not be appropriate due to changes in the methodology used to calculate per capita consumption.

The data depicted in the graph above are detailed in the table on page three of this bulletin. The graphs on pages 2 and 4 depict per capita consumption patterns for each category of fats and oils over the past 26 years. The March 2006 edition of Oil Crops Situation and Outlook Yearbook, published by the Economic Research Service, is the source for all data used in this bulletin.

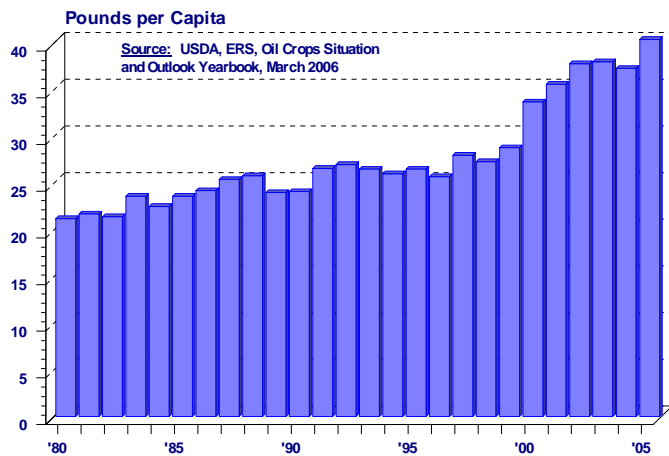

## Per Capita Consumption of Fats and Oils in Food Products: Butter

Per capita consumption of margarine has decreased in 10 out of the last 12 years, and has not increased on a year-to-year basis since 1993. Moreover, margarine consumption per capita increased in only 6 years during the period depicted in the accompanying graph.

Margarine consumption in 2005 totaled 4.1 pounds per person, which was the lowest amount registered during the 1980 through 2005 period. 2005 consumption was only 36.0% of the 11.4 pounds per capita that was recorded during 1980.

## Per Capita Consumption of Fats and Oils in Food Products: Salad / Cooking

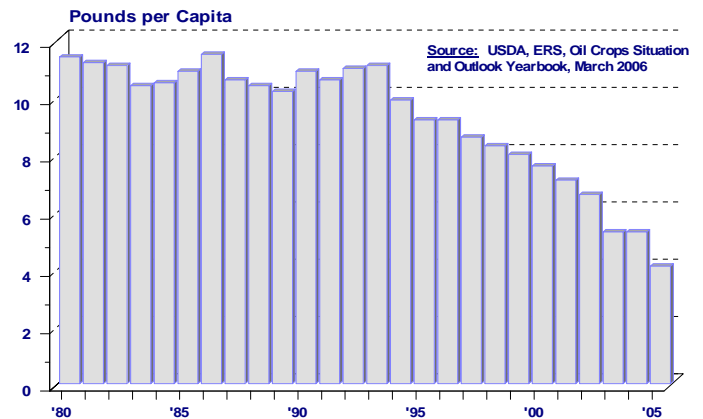

Per capita consumption of fats and oils in the baking and frying category totaled 30.5 pounds in 2005, a decrease of 2.3 pounds (-7.0%) compared with 2004. This was the third consecutive year that per capita consumption decreased for this category. Comparing 2005 with 2000, consumption of fats and oils in baking and frying has decreased by 1.1 pounds per capita (-3.5%).

Even though comparisons to years prior to 2000 may not be appropriate due to data source limitations, the overall trend for this category had been one of increasing per capita consumption prior to the last three

Butter consumption per person for 2000 through 2005 remained virtually unchanged, with maximum year-to-year variation of 0.1 pounds. Over the 26 years depicted in the accompanying graph, butter consumption has ranged from a high of 4.9 pounds per capita during 1983-85 to a low of 4.1 pound in 1997. Per capita consumption of butter totaled 4.5 pounds during 2005.

Butter consumption in 2005 was 109.8% of margarine usage on a per capita basis. This was the highest ratio recorded during the 1980 through 2005 period. The average butter-to-margarine ratio during this period was 52.2%, with a low of 37.5% in 1981.

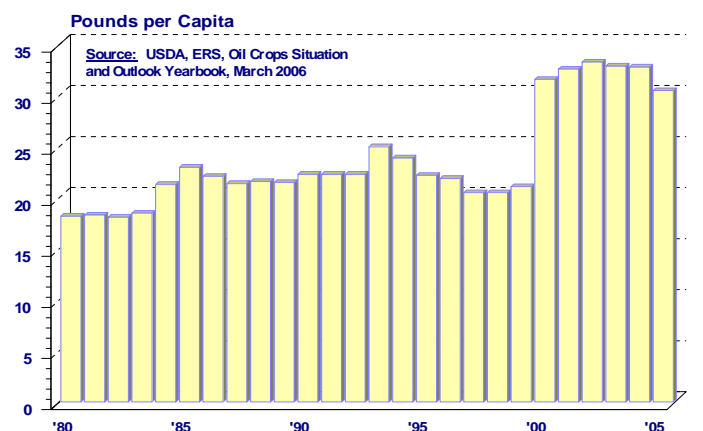

## Per Capita Consumption of Fats and Oils in Food Products: Margarine

The trend in per capita consumption of fats and oils in salad and cooking has exhibited a persistent upward trend over the 26 years depicted in the graph to the left. The estimate for 2005 for this category was 40.4 pounds per person, an increase of 6.7 pounds (+19.9%) compared with 2000.

Comparisons to years prior to 2000 may not be appropriate due to the data source changes previously noted. However, the trend of increasing per capita consumption of fats and oils in the salad/cooking category is prevalent during both periods covered by the different data sources.

## Per Capita Consumption of Fats and Oils in Food Products: Baking / Frying
